

Power BI - All about DAX - Lecture 7

MEET DAX

Data Analysis Expressions (commonly known as DAX) is the formula language that drives the Power BI front-end. With DAX, you can:

- Go beyond the capabilities of traditional spreadsheet formulas, with powerful and flexible functions built specifically to work with relational data models.
- Add calculated columns (for filtering) and measures (for aggregation) to enhance data models.

M VS. DAX

M and DAX are two distinct functional languages used within Power BI Desktop:

- M is used in the Power Query editor, and is designed specifically for extracting, transforming and loading data.
- DAX is used in the Power BI front-end, and is designed specifically for analyzing relational data models

M CODE

Query Editor:

```

#"Changed Type" = Table.TransformColumnTypes(
    #"Promoted Headers", // after we promoted headers
    {
        {"SalesTerritoryKey", Int64.Type}, // that changes column datatypes
        {"Region", type text},
        {"Country", type text},
        {"Continent", type text}
    }
)

```

DAX

Report View:

Category Name	Total Returns	Bike Returns
Accessories	1,115	
Bikes	427	427
Clothing	267	
Total	1,809	427

```

1 Bike Returns =
2 CALCULATE(
3     [Total Returns],
4     'Product Categories Lookup'[Category Name] = "Bikes" // filtered for bikes only
5 )

```

DAX

1. Calculated Columns
2. Measures :
 - A. Implicit Measure
 - B. Explicit Measure

Mountain Bike Returns =
 $\text{CALCULATE}([\text{Bike Returns}],$
 $\text{'Product Subcategory Lookup'}[\text{Subcategory Name}] =$
 $"\text{Mountain Bike}")$

Implicit Measure

All Orders = $\text{CALCULATE}(\text{Measure}, \text{Filter})$

Reference Measure.

CALCULATED COLUMNS

Calculated columns allow you to add new, formula-based columns to tables in a model

- Calculated columns refer to entire tables or columns (no A1-style cell references).
- Calculated columns generate values for each row, which are visible within tables in the Data view.
- Calculated columns understand row context; they're great for defining properties based on information in each row, but generally useless for aggregation (sum, count, etc.)

HEY THIS IS IMPORTANT!

As a rule of thumb, use calculated columns to "stamp" static, fixed values to each row in a table (or go upstream and use the Query Editor!) DO NOT use calculated columns for aggregation – this is what measures are for!

PRO TIP:

Calculated columns are typically used for filtering & grouping data, rather than creating aggregate numerical values

EXAMPLE: CALCULATED COLUMNS

Email Address	Annual Income	Total Children	Education Level	Parent
emma32@adventure-works.com	70000	5	Bachelors	Yes
barry20@adventure-works.com	40000	5	High School	Yes
martha13@adventure-works.com	70000	5	High School	Yes
tamara16@adventure-works.com	40000	5	High School	Yes
gerald21@adventure-works.com	130000	5	Bachelors	Yes
alexa8@adventure-works.com	40000	5	High School	Yes
jack53@adventure-works.com	70000	5	Graduate Degree	Yes
ricky1@adventure-works.com	100000	5	Bachelors	Yes
keith4@adventure-works.com	70000	5	Partial College	Yes
latoya19@adventure-works.com	70000	5	Bachelors	Yes

In this case we've added a calculated column named Parent, which equals "Yes" if the [Total Children] field is greater than 0, and "No" otherwise

- Since calculated columns understand row context, a new value is calculated in each row based on the value in the [Total Children] column.
- This is a valid use of calculated columns; it creates a new row "property" that we can use to filter or segment any related data within the model.

Here we're using an aggregation function (SUM) to calculate a new column named Total Quantity

The screenshot shows a Power BI Data View window. A yellow box highlights the 'TotalQuantity' column header. The formula bar at the top contains the DAX formula: `TotalQuantity = SUM('Sales Data'[Order Quantity])`. The table has columns: Order Date, Order Number, Product Key, Customer Key, Territory Key, Order Line Item, Order Quantity, Index, and TotalQuantity. The TotalQuantity column contains values like 1205, 1228, 1267, etc.

- Since this is an aggregation function, the same grand total is returned in every row of the table
- This is not a valid use of calculated columns; these values are statically "stamped" onto the table and can't be filtered, sliced, etc.

DAX MEASURES

Measures are DAX formulas used to generate new calculated values

- Like calculated columns, measures reference entire tables or columns (no A1-style cell references).
- Unlike calculated columns, measures aren't visible within tables; they can only be "seen" within a visualization like a chart or matrix (similar to a calculated field in a PivotTable).
- Measures evaluate based on filter context, which means they recalculate when the fields or filters around them change.

HEY THIS IS IMPORTANT!

As a rule of thumb, use measures when a single row can't give you the answer, or when you need to aggregate values across multiple rows in a table

PRO TIP:

Use measures to create numerical, calculated values that can be analyzed in the "values" field of a report visual

IMPLICIT VS. EXPLICIT MEASURES

The screenshot shows the 'Build a visual' interface in Power BI. On the left, under 'Y-axis', there is a box containing 'Sum of Order ...'. To its right, a yellow box highlights the 'Σ Order Quantity' option from a dropdown menu. This indicates that the measure was created implicitly by dragging a raw numerical field into the visualization.

Implicit measures are created when you drag raw numerical fields into a report visual and manually select an aggregation mode (Sum, Average, Min, Max, Count, etc.)

Explicit measures are created when you actually write a DAX formula and define a new measure that can be used within the model

Example of an implicit measure

HEY THIS IS IMPORTANT!

Implicit measures are only accessible within the specific visualization in which they were created, and cannot be referenced elsewhere.

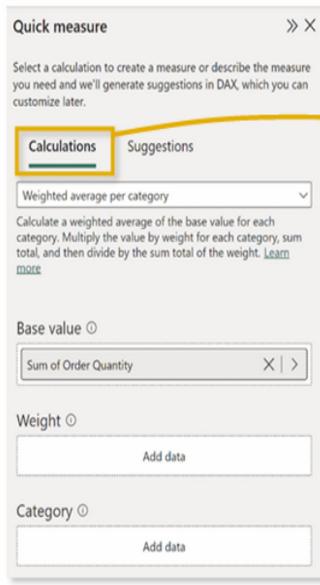

Explicit measures can be used anywhere in the report, and referenced by other DAX calculations to create "measure trees".

The screenshot shows the 'Build a visual' interface. In the 'Values' section, there are two measures: 'Sum of OrderQuantity' and 'Sum of ReturnQuantity'. A blue box highlights the 'Sum' option in the dropdown menu for 'Sum of OrderQuantity', indicating that this measure was defined explicitly using a DAX formula.

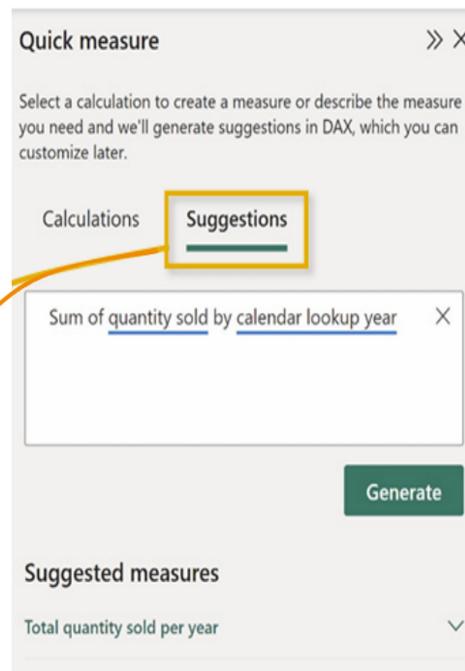

Implicit Measures.

QUICK MEASURES

Quick measures automatically create formulas based on pre-built templates or natural language prompts

Quick measure calculations can be used to build measures using predefined templates (weighted averages, percent difference, time intelligence, etc.)

Quick measure suggestions can be used to find suggested measures based on natural language queries (i.e. "sum of quantity sold by calendar year")

PRO TIP:

Quick measures can be a great learning tool for beginners or for building more complex formulas but use them with caution; mastering DAX requires a deep understanding of the underlying theory!

RECAP: CALCULATED COLUMNS VS. MEASURES

CALCULATED COLUMNS

MEASURES

- Values are calculated based on information from each row of a table (row context)
- Appends static values to each row in a table and stores them in the model (which increases file size)
- Recalculate on data source refresh or when changes are made to component columns
- Primarily used for filtering data in reports

							Parent = IF([Customer Lookup'[Total Children]>0,"Yes","No"]
Birth Date		Marital Status		Email Address		Annual Income	Total Children
9/2/1941	M	emma21@adventure-works.com		70000	5	Bachelors	Yes
9/24/1987	M	barry20@adventure-works.com		40000	5	High School	Yes
8/3/1941	M	martha13@adventure-works.com		70000	5	High School	Yes
6/4/1968	S	tarra23@adventure-works.com		40000	5	High School	Yes
10/26/1970	S	geral21@adventure-works.com		130000	3	Bachelors	Yes
5/20/1945	M	alex21@adventure-works.com		40000	5	High School	Yes
9/24/1938	M	jack53@adventure-works.com		70000	5	Graduate Degree	Yes
7/21/1959	S	ricky1@adventure-works.com		200000	3	Bachelors	Yes
1/6/1960	M	kathy4@adventure-works.com		20000	5	Partial College	Yes
8/25/1962	M	latoya13@adventure-works.com		70000	5	Bachelors	Yes
2/26/1997	S	michael11@adventure-works.com		70000	3	Bachelors	Yes
3/8/1946	M	mindy22@adventure-works.com		80000	3	Partial College	Yes
6/11/1960	M	teresa8@adventure-works.com		70000	5	Partial College	Yes

Calculated columns "live" in tables

- Values are calculated based on information from any filters in the report (filter context)

- Does not create new data in the tables themselves (doesn't increase file size)

- Recalculate in response to any change to filters within the report

- Primarily used for aggregating values in report visuals

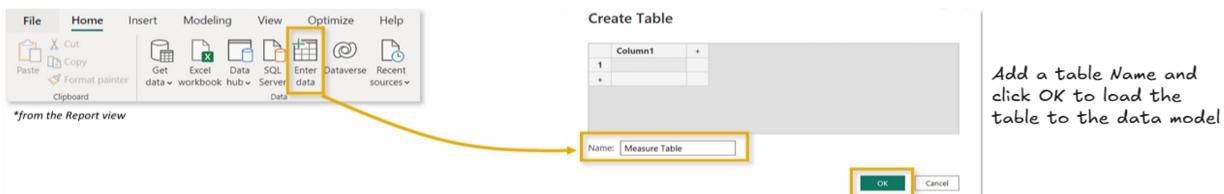

Measures "live" in visuals

PRO TIP: MEASURE TABLES

It's a common best practice to create a dedicated table to store your measures; this will help you stay organized, find measures quickly, and allow you to group related measures into folders.

Option 1: Enter Data into Power Query (loads the table to the data model – table is visible in Power Query)

Option 2: Create a calculated table using DAX directly in the model (table is not visible in Power Query)

FILTER CONTEXT

Measures are evaluated based on filter context, which means that they recalculate whenever the fields or filters around them change

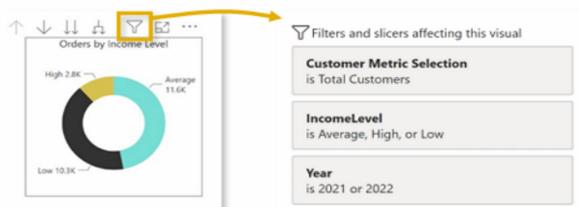

Top 10 Products		Orders	Revenue	Return %
Water Bottle - 30 oz.		3,983	\$39,755	1.95%
Patch Kit/8 Patches		2,952	\$13,506	1.61%
Mountain Tire Tube		2,846	\$28,333	1.64%
Road Tire Tube		2,173	\$17,265	1.55%
Sport-100 Helmet, Red		2,099	\$73,444	3.33%
AWC Logo Cap		2,062	\$35,865	1.11%
Sport-100 Helmet, Blue		1,995	\$67,112	3.31%
Fender Set - Mountain		1,975	\$87,041	1.36%
Sport-100 Helmet, Black		1,940	\$65,262	2.68%
Mountain Bottle Cage		1,896	\$38,062	2.02%
Total		15,587	\$465,644	1.85%

For this value in the matrix (2,846), the Orders measure is calculated based on the following filter context: Products[Product Name] = "Mountain Tire Tube"

- This allows the measure to return the total order quantity for each product specifically (or whatever context the row and column labels dictate – years, countries, categories, customer names, etc.)

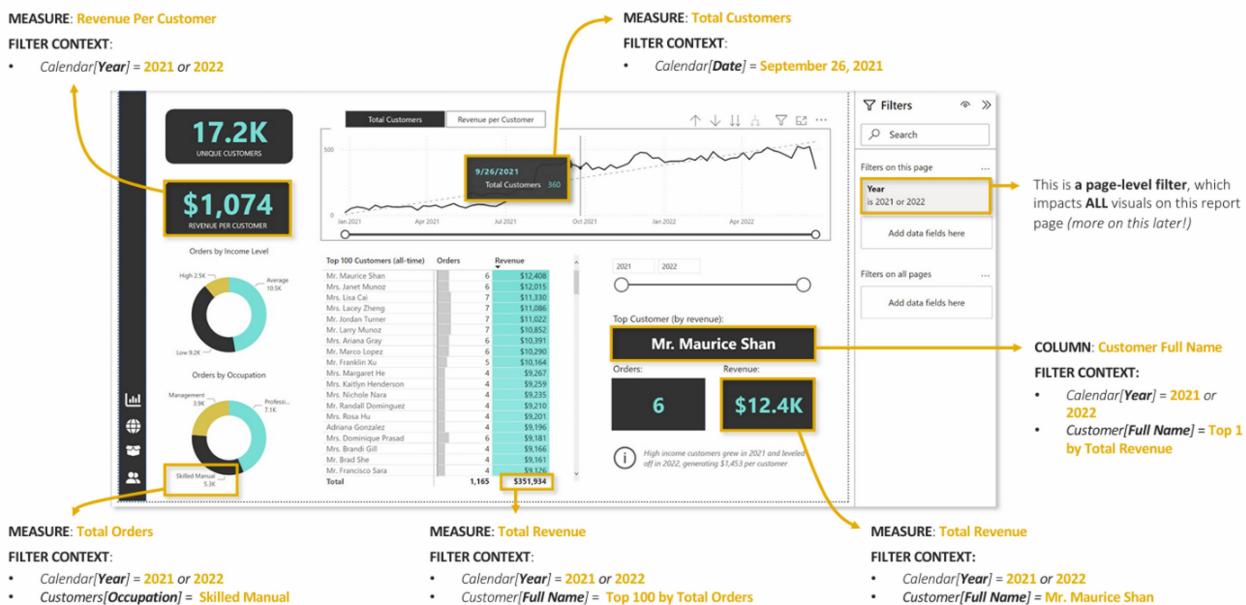

This total (15,587) does NOT calculate by summing the values above; it evaluates as an independent measure with no filter context applied

- IMPORTANT: Every measure value in a report evaluates independently (like an island) and calculates based on its own filter context

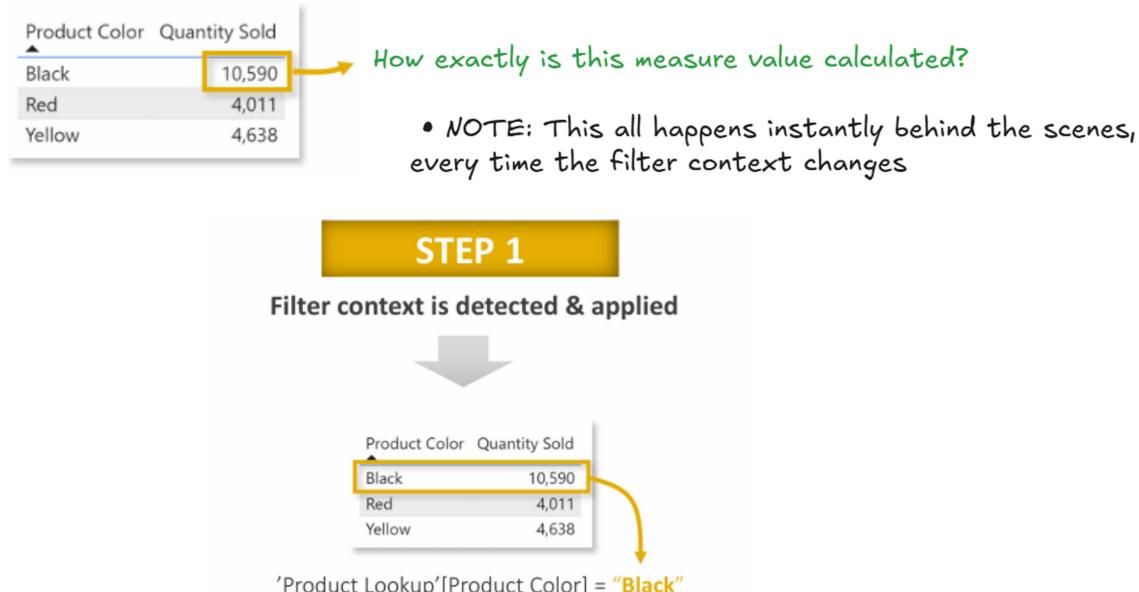

PRO TIP: Clicking the filter icon will show you the filters currently applied to a selected visual

EXAMPLE: FILTER CONTEXT

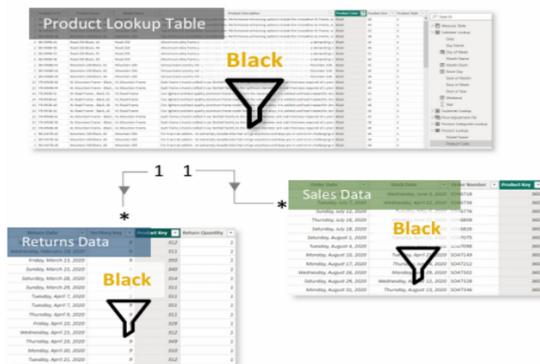

STEP-BY-STEP MEASURE CALCULATION

STEP 2

Filters flow “downstream” to related tables

STEP 3

Measure evaluates against the filtered table

```

1 Quantity Sold =
2 SUM(
3   |   'Sales Data'[Order Quantity]
4 )
  
```

*Sum of values in the **Order Quantity** column of the **Sales Data** table, filtered to rows where the product color is “**Black**”*

= **10,590**

DAX SYNTAX

MEASURE NAME

- Measures are always surrounded by brackets (i.e. [Total Quantity]) when referenced in formulas, so spaces are OK

Referenced TABLE NAME

Referenced COLUMN NAME

Total Quantity: = SUM(Transactions[quantity])

FUNCTION NAME

- Calculated columns don't always use functions, but measures do:
 - In a Calculated Column, =Transactions[quantity] returns the value from the quantity column in each row (since it evaluates one row at a time).
 - In a Measure, = Transactions[quantity] will return an error since Power BI doesn't know how to translate that as a single value – you need some sort of aggregation

This is a “fully qualified” column, since it's preceded by the table name.

NOTE: Table names with spaces must be surrounded by single quotes:

- Without a space: Transactions[quantity]
- With a space: 'Transactions Table'[quantity]

PRO TIP:

Column references use fully qualified names (i.e. 'Table'[Column])

Measure references just use the measure name (i.e. [Measure]) and can be called by typing an open square bracket "["

DAX OPERATORS

Arithmetic Operator	Meaning	Example
+	Addition	2 + 7
-	Subtraction	5 - 3
*	Multiplication	2 * 6
/	Division	4 / 2
^	Exponent	2 ^ 5

Comparison Operator	Meaning	Example
=	Equal to	[City] = "Boston"
>	Greater than	[Quantity] > 10
<	Less than	[Quantity] < 10
>=	Greater than or equal to	[Unit Price] >= 2.5
<=	Less than or equal to	[Unit Price] <= 2.5
!= <>	Not equal to	[Country] <> "Mexico"

"Important"

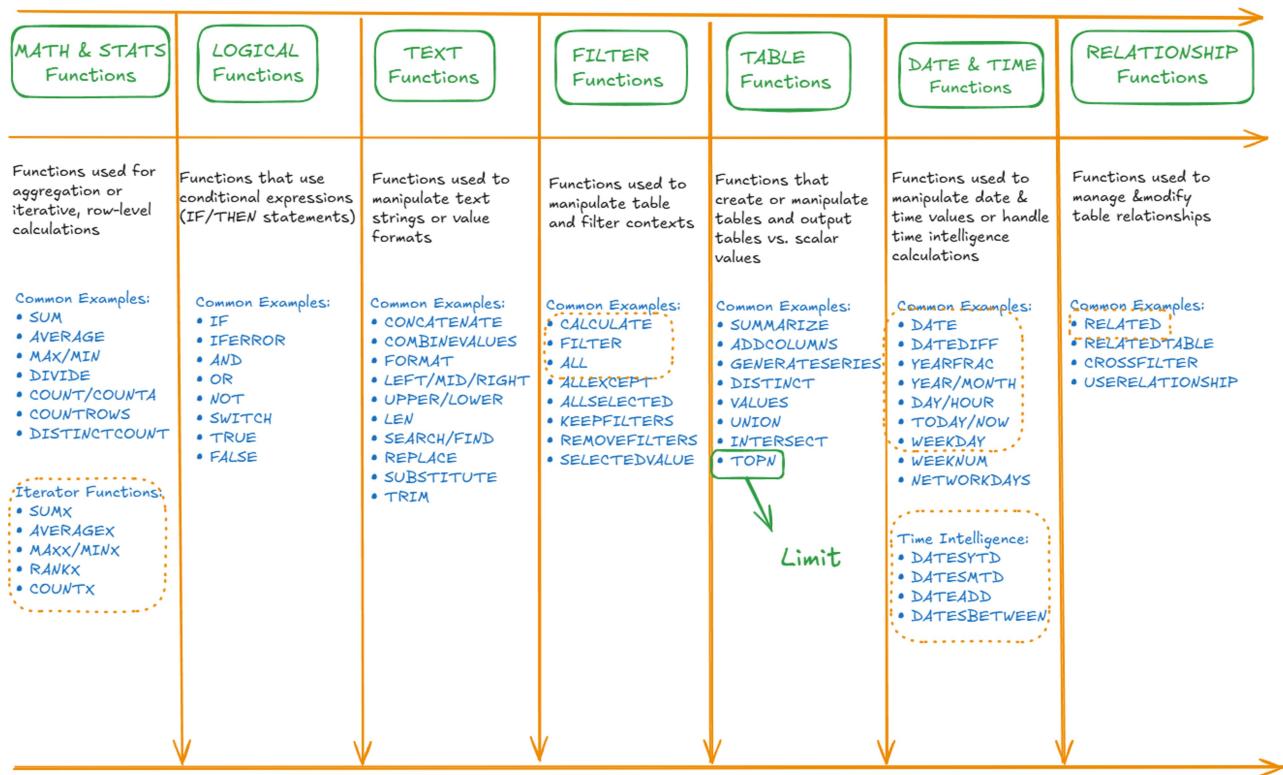

OR(logic1 , logic2)
AND(logic1 , logic2)

Text/Logical Operator	Meaning	Example
&	Concatenates two values to produce one text string	[City] & " " & [State]
&&	Create an AND condition between two logical expressions	([State] = "MA") && ([Quantity] > 10)
 (double pipe)	Create an OR condition between two logical expressions	([State] = "MA") ([State] = "CT")
IN	Creates a logical OR condition based on a given list (using curly brackets)	'Store Lookup'[State] IN { "MA", "CT", "NY" }

SELECT * FROM Users WHERE Year = 2000 OR year = 2001
OR year = 2002 OR Year = 2003 OR year = 2004.

SELECT * FROM Users WHERE Year in (2000,2001,2002,2003,2004).

COMMON FUNCTION CATEGORIES

$$\text{Set1} = \{1,2,3,4,5,6\}$$

$$\text{Set1 Union Set2} = \{1,2,3,4,5,6,7,8\}$$

$$\text{Set2} = \{4,6,7,8\}$$

$$\text{Set1 intersect Set2} = \{4,6\}$$
